

# The Ghana Cocoa Report 2024: Galamsey and Its Impact on Ghana Cocoa: Trends and Future Forecasts

Explore how illegal mining, or galamsey, is affecting Ghana's cocoa industry, with insights on production trends, environmental degradation, and future forecasts. Learn about potential solutions to protect this vital sector.

## Highlights

Illegal mining, or *galamsey*, has significantly affected Ghana's cocoa sector, causing deforestation and loss of farmland.

The environmental degradation caused by galamsey activities is threatening the sustainability of cocoa production.

If left unchecked, illegal mining could reduce Ghana's cocoa output by up to 15% by 2030.

## Highlights

Illegal mining, or *galamsey*, has significantly affected Ghana's cocoa sector, causing deforestation and loss of farmland.

The environmental degradation caused by galamsey activities is threatening the sustainability of cocoa production.

If left unchecked, illegal mining could reduce Ghana's cocoa output by up to 15% by 2030.

## **Research Methodology**

This article uses a multi-method research approach that combines data from the Ghana Cocoa Board (COCOBOD), environmental impact assessments, and academic research on the relationship between illegal mining and agricultural land use in Ghana. The study includes both quantitative data analysis and qualitative insights from stakeholder interviews with farmers, local authorities, and industry experts. The analysis is focused on understanding how illegal mining impacts cocoa production trends and the future sustainability of Ghana's cocoa sector.

## Key Statistics and Facts

1. Ghana is the second-largest cocoa producer in the world, contributing approximately 15-20% of global cocoa supply.
2. Illegal mining has led to the loss of an estimated 19,000 hectares of cocoa farmland in Ghana over the past decade.
3. Galamsey activities have contributed to the deforestation of over 260,000 hectares of forested land in cocoa-growing regions.
4. Ghana's cocoa production declined by 5% in 2023 due to the encroachment of illegal mining on cocoa farms.
5. Up to 60% of rivers in cocoa-growing regions have been contaminated by chemicals used in illegal mining, such as mercury and cyanide.
6. The Ghanaian cocoa industry supports over 800,000 smallholder farmers, many of whom have lost land to illegal mining.
7. Illegal mining activities in cocoa-growing regions have caused an annual revenue loss of over \$250 million in the cocoa sector.
8. Government initiatives to curb illegal mining have seized over 500 mining equipment and arrested more than 1,000 illegal miners since 2020.
9. Cocoa land affected by galamsey requires up to 10 years of rehabilitation to restore soil fertility and productivity.
10. Experts project that if galamsey continues at its current pace, Ghana's cocoa production could decrease by 10-15% by 2030.

## Body of Article / Critical Analysis

### The Impact of Galamsey on Ghana's Cocoa Sector

Illegal mining, commonly known as *galamsey* in Ghana, poses one of the most severe threats to the country's cocoa sector. As the world's second-largest cocoa producer, Ghana depends heavily on cocoa for its export earnings, rural employment, and economic stability. However, the increasing encroachment of illegal mining on cocoa farmlands is undermining this critical industry. *Galamsey* activities, often unregulated and environmentally destructive, have led to widespread deforestation, loss of fertile agricultural land, and water contamination, all of which directly impact cocoa production.

#### Deforestation and Land Loss

One of the most immediate effects of *galamsey* on cocoa production is the large-scale deforestation occurring in cocoa-growing regions. Illegal miners clear large swathes of forested land to access mineral-rich deposits, destroying cocoa farms in the process. It is estimated that over 19,000 hectares of cocoa farmland have been lost to illegal mining activities over the past decade. This loss of arable land has contributed to a decline in cocoa output, as farmers are forced to abandon their farms or shift to less fertile areas.

Deforestation also has broader ecological implications for the cocoa sector. Forests help regulate local climates, providing shade and moisture retention, which are essential for cocoa cultivation. The removal of trees leads to increased temperatures and reduced rainfall, exacerbating the challenges already posed by climate change. These conditions are detrimental to cocoa productivity and the long-term sustainability of the industry.

#### Water Contamination

Illegal mining also contributes to widespread water contamination, which negatively affects both human populations and cocoa farming. *Galamsey* operations often involve the use of toxic chemicals such as mercury and cyanide to extract gold, which subsequently seep into rivers and streams. In Ghana's cocoa-growing regions, up to 60% of water bodies have been polluted by illegal mining activities, rendering them unsuitable for irrigation or human consumption.

Contaminated water poses a significant risk to cocoa trees, as the plants absorb harmful chemicals through irrigation. These toxins not only stunt the growth of cocoa trees but also affect the quality of cocoa beans, reducing their market value. In some cases, prolonged exposure to contaminated water has led to the death of cocoa plants, further exacerbating the loss of productive farmland.

#### Economic Implications

The economic toll of *galamsey* on Ghana's cocoa industry is substantial. With cocoa contributing roughly 30% of Ghana's total export earnings, any decline in production directly impacts the country's foreign exchange reserves and overall economic health. The estimated annual revenue loss due to land degradation caused by illegal mining exceeds \$250 million. For smallholder farmers, the loss of farmland to illegal mining represents a direct hit to their livelihoods, as cocoa farming is often their primary source of income.

Additionally, the reduction in cocoa production has ripple effects on Ghana's global market share. As one of the leading cocoa exporters, any sustained decrease in output weakens Ghana's position in the international cocoa market, allowing competitors like Côte d'Ivoire to capture a larger share of the market.

## Current Top 10 Factors Impacting the Cocoa Industry Due to Galamsey

- 1. Land Degradation:** The loss of fertile cocoa farmland to illegal mining activities.
- 2. Deforestation:** Large-scale deforestation in cocoa-growing areas exacerbates climate challenges and reduces productive land.
- 3. Water Contamination:** The pollution of rivers and streams with toxic chemicals used in mining operations.
- 4. Decline in Cocoa Yields:** Reduced productivity due to soil degradation, deforestation, and water contamination.
- 5. Farmer Displacement:** Smallholder cocoa farmers losing access to their land as illegal miners encroach on farming areas.
- 6. Economic Losses:** Annual revenue loss exceeding \$250 million due to illegal mining's impact on cocoa production.
- 7. Increased Soil Erosion:** The removal of tree cover leads to soil erosion, reducing land fertility and cocoa crop resilience.
- 8. Government Efforts:** The effectiveness of government-led initiatives to combat illegal mining and reclaim cocoa farmlands.
- 9. Cocoa Quality Decline:** Contamination and poor farming conditions leading to a reduction in the quality of Ghanaian cocoa beans.
- 10. International Pressure:** Global demand for sustainably sourced cocoa and the reputational risks of illegal mining activities on Ghana's cocoa exports.

## Projections and Recommendations

### Projections:

**Continued Production Decline:** If galamsey continues at its current rate, Ghana could see a 10-15% decline in cocoa production by 2030, reducing export revenues and impacting rural livelihoods.

**Increased Rehabilitation Costs:** The cost of rehabilitating land degraded by illegal mining is expected to rise, with projections suggesting that restoring affected cocoa lands could take up to a decade.

**Stricter Enforcement:** As the international demand for sustainable cocoa grows, Ghana may face increasing pressure to implement and enforce stricter anti-illegal mining regulations.

### Recommendations:

**1. Strengthen Anti-Galamsey Policies:** The Ghanaian government should enforce stricter regulations to combat illegal mining and reclaim cocoa farmlands, including harsher penalties for violators.

**2. Promote Sustainable Land Use:** Encourage the adoption of sustainable land management practices that balance mining activities with the preservation of agricultural land.

**3. Increase Investment in Land Rehabilitation:** Allocate more resources to rehabilitate land affected by illegal mining, ensuring that soil fertility and productivity can be restored.

**4. Support Farmers Affected by Galamsey:** Provide financial assistance and alternative livelihoods for farmers displaced by illegal mining, helping them recover their lost income.

**5. Enhance Public Awareness Campaigns:** Implement public awareness campaigns to highlight the long-term economic and environmental costs of illegal mining on cocoa production.

## Conclusions

Illegal mining, or *galamsey*, poses a serious threat to Ghana's cocoa sector. The loss of farmland, deforestation, and water contamination are undermining the country's cocoa production, with significant economic, environmental, and social consequences. To protect this vital industry, Ghana must strengthen its efforts to combat illegal mining, promote sustainable land use, and support farmers in affected regions. Without decisive action, the future of Ghana's cocoa sector—and its contributions to both the national and global economy—remain at risk.

## **Notes**

Data used in this article is derived from reports by COCOBOD, Ghana's Ministry of Lands and Natural Resources, and environmental impact studies conducted by academic institutions and NGOs.
